A/B TESTING & INCREMENTALITY

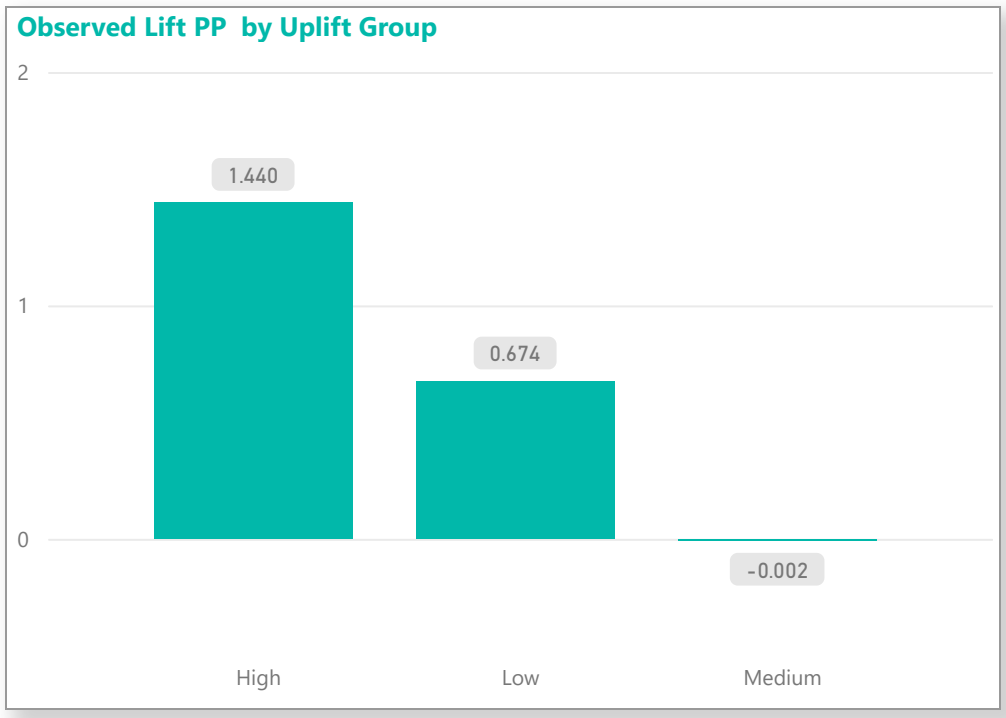

A/B TEST STATISTICAL RESULTS

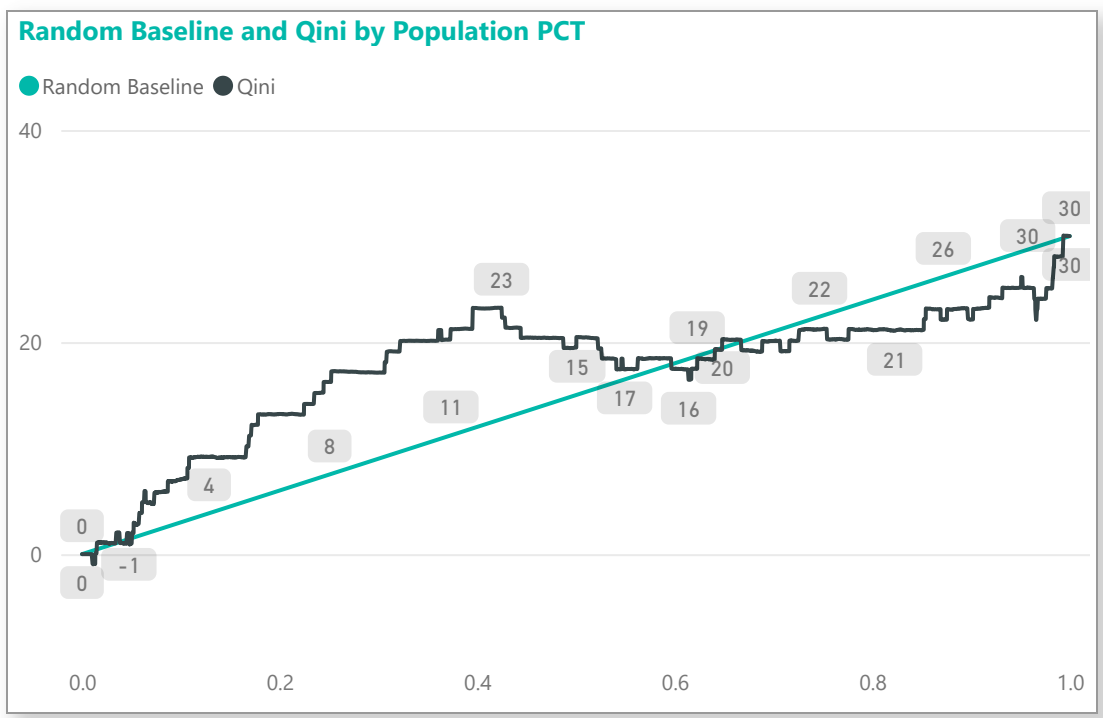

Campaign	Absolute Lift PP	CI LOW PP	CI HIGH PP	Adjusted p_value
Mens E-Mail	0.68	0.50	0.86	3.0464470012E-013
Womens E-Mail	0.31	0.15	0.47	1.5710512911E-004

Experiment Findings

- Both email treatments achieved statistically significant positive conversion lift compared with the No E-Mail control group, after Holm adjustment for multiple testing.
- Mens E-Mail generated the larger observed lift (+0.681 pp), compared with Womens E-Mail (+0.311 pp).
- The analysis does not yet establish whether the difference between the two email treatments is statistically significant

UPLIFT MODEL PERFORMANCE

95% CONFIDENCE INTERVAL

Uplift Group	Observed Lift PP	CI LOW PP	CI HIGH PP
High	1.440	0.731	2.282
Low	0.674	-0.070	1.466
Medium	-0.002	-0.698	0.694

QINI COEFFICIENT = 2.5543

Experiment Findings

- The T-Learner model shows a positive signal for the "High Uplift" group, with an observed lift of +1.440 percentage points (pp) and a 95% confidence interval of [+0.731, +2.282] pp.
- However, the Qini curve does not outperform the random baseline across the entire population. Therefore, a positive Qini coefficient is insufficient to conclude that the model is ready for deployment.

EXECUTIVE SUMMARY

64K	578	0.90%
Total Customers	Total Conversions	Conversion Rate

16.40K	9.08K	2.55
Mens Incremental Revenue	Womens Incremental Revenue	QINI Coefficient

Key Findings

Mens E-Mail delivered the highest observed conversion rate and estimated incremental revenue. Both treatments showed positive, statistically significant conversion lift relative to the control.

Model Evaluation

The T-Learner showed promising uplift ranking among highly ranked customers, but results were inconsistent across the full population.

Business Recommendation

- Validate model stability and campaign economics before making targeting or investment decisions
